

CRUCIAL FOR FUTURE MODIFICATION (i.e. adding the actual rooms for each presentation time):

- Modify /home/your_username/mysite/signUp.html
- Change BOTH the “value” and the display text for each option in the select tag
 - The value is what’s used in the DB and having it match what the users see is both for convenience and ease of understanding

Here’s the script to create the database and test that it is working:

NOTE: copying and pasting these lines into the mysql command line may require retyping the ‘ characters as pythonanywhere must use different encoding for them.

```
CREATE TABLE users (studentID int(10) NOT NULL, name varchar(255) NOT NULL,
presentTime varchar(40) NOT NULL, modify bool DEFAULT 0, PRIMARY
KEY(studentID));
```

FOR TESTING:

```
INSERT INTO users (name, studentID, presentTime) VALUES ('user1',
0003516180, 'someDate'), ('user2', 0003516180, 'someOtherDate');
```

```
SELECT * FROM users;
```

Should return two users with ids 1 and 2 with someData and someOtherDate as presentaton times

In signUp.html, go to the body tags and modify the

```
<a class="navbar-brand" href="#">240 Final Projects Sign-Up</a>
```

Tag to make it appropriate for the class it is being used for
